

# Digital Scanning Laser Vibrometer

# SWIR Scanning Laser Vibrometer

Scanning Laser Doppler Vibrometry is an advanced measurement technique for the visualization of vibrations on the surface of nearly any object. Scanning Laser Vibrometer can measure and visualize vibration shapes and eigenmodes, capture the propagation of surface waves, validate FEM models, characterize vibration processes, and determine modal parameters.

# HIGHLIGHTS

- Excellent signal level
- Very compact
- Easy to operate
- Highest accuracy and resolution
- High-speed vibrations up to 30 m/s
- Long-distance measurements

### IMAGING VIBRATION MEASUREMENT

The Scan-Series combine the superior signal quality of SWIR laser vibrometry with the informative value of imaging methods by scanning the object under test on a flexibly definable point grid. Different measurement surfaces, wider coverage, and measuring ranges are the key to new fields of application.

Scanning vibrometry makes it possible to test entire workpieces automatically in one measurement process without contact or any influence on the object. Thus, scanning vibrometry enables the capture of local resonances and global vibration modes with the lowest effort.

## Applications

#### Acoustics

- Automotive industry: Optimization of car door, automotive transmission, brakes, motor, NVH testing...
- Consumer market: Development of household appliance, electronic toothbrush, washing machine...
- Optimization of deflection shapes in loudspeaker, musical instruments...

#### Structrual Dynamics

- Automotive industry: Modal analysis, FE-model validation...
- Aviation and Aerospace industry: Airplane components, turbines...
- Material Research: non-destructive evaluation of material properties, material defect analysis...

#### **Example applications:**

Automotive industry

Material research & testing

Aerospace industry

Toolmaking and Mechanical Engineering

Electronics

Civil Engineering

#### Set up

- Geometry definition

- Mesh generation / import
- Setup of the data acquisition / generator system

# **Automatic Scan**

- The whole grid is automatically scanned by the laser beam.

- making measurements at each grid point
- Time response and frequency response of each point and reference signals are displayed in real time during the scan.

# Visualization / Analysis

- 3D Animation to display your ODS
- (Operation deflection shape)
- Modal analysis
- Data export
- FEM model validation
